Phase#1 Project Proposal

Project overview:

This project comprises several phases. The current report focuses on phase one, which is dedicated to problem formulation. This involves selecting one or more datasets; we chose datasets related to tourism and employment in the Kingdom of Saudi Arabia for the years 2021-2022.

Problem Statement:

The objective of this study is to analyze and understand the patterns and trends associated with tourism in the Kingdom of Saudi Arabia during the years 2021-2022. Additionally, the study aims to examine the dynamics of employment in the Kingdom of Saudi Arabia over the same period. By investigating these aspects, we seek to identify key factors influencing tourism and employment and provide insights that can inform decision-making and policy formulation in the relevant sectors.

Link to our datasets:

- https://studentksuedu-my.sharepoint.com/personal/443200371_student_ksu_edu_sa/Documents/DSS_DATASET.xlsx
- [DSS_DATASET.xlsx](#)

Note: Please be advised that both links are identical, yet we are presenting both as a precaution in case one malfunctions.

Phase#2: Identify the Key Performance Indicators (KPIs)

Our Key Performance Indicators (KPIs):

For the Employment Dataset:

1. Number of Employments per Quarter.
2. Number of Employments by Citizenship.
3. Number of Employments per Gender.
4. Ratio of Gender by Citizenship.
5. Ratio of Saudi to Non-Saudi Employment.

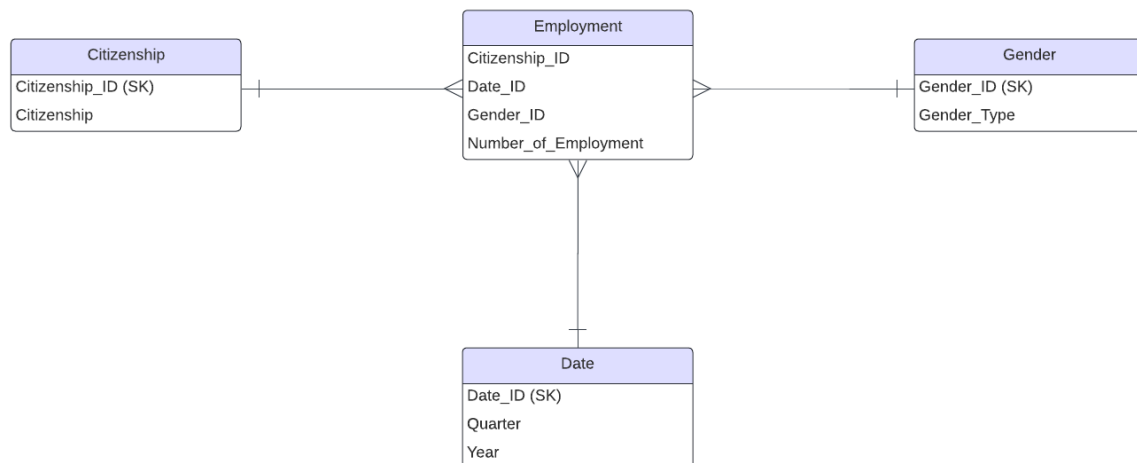

For the Tourism Dataset:

1. Number of Tourists per Month.
2. Number of Tourists by Citizenship.
3. Number of Tourists by Purpose of Trips.
4. Number of Tourists by Mode of Departure.
5. Number of Tourists per Region.

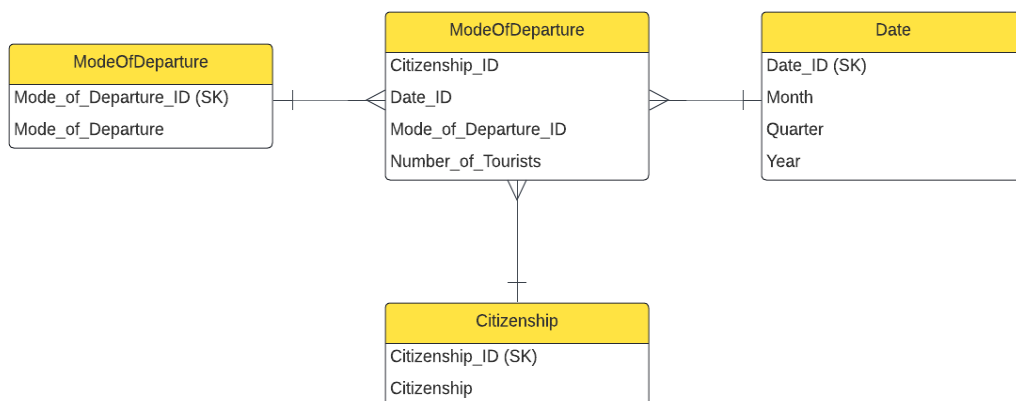

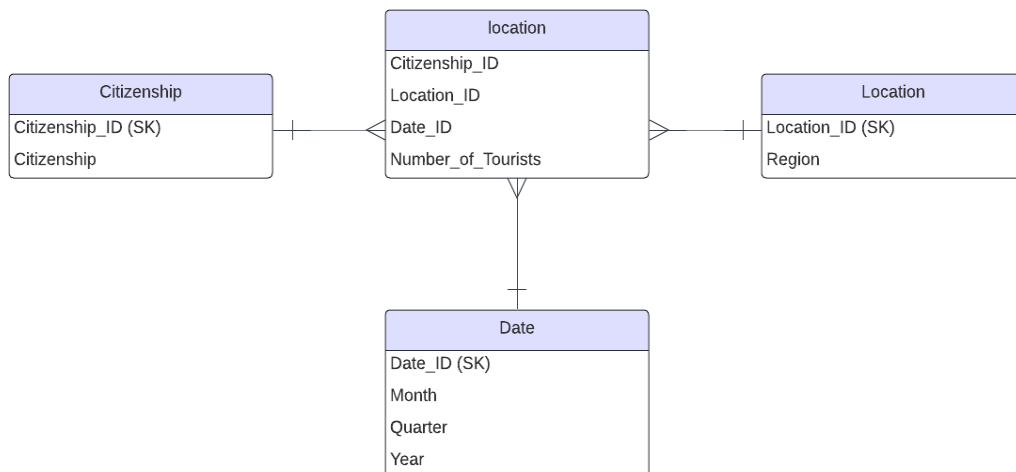

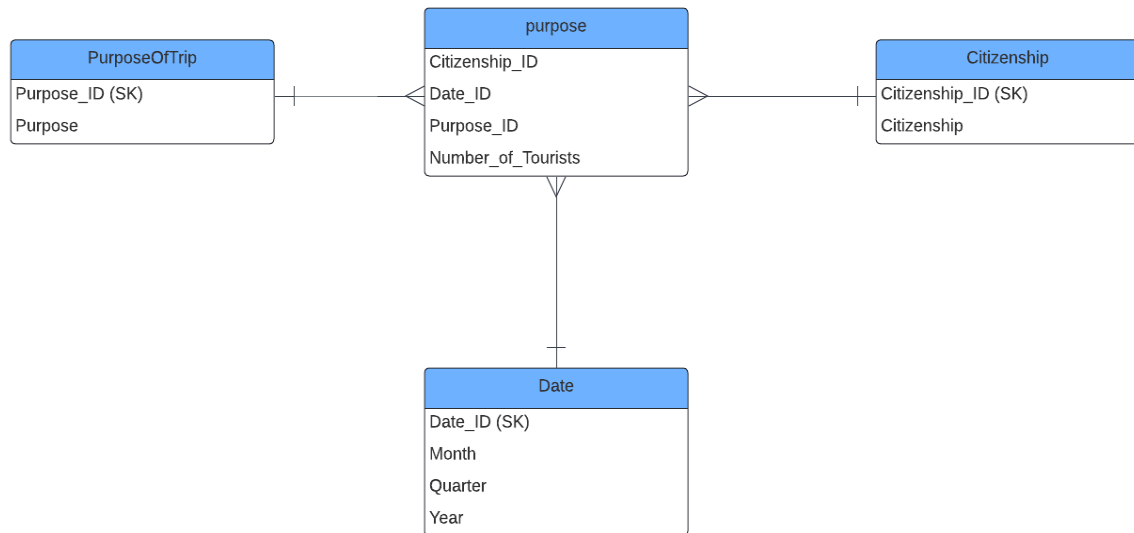

Phase#3: Data Modeling

Star Schema for Each Dataset.

For The Employment Dataset:

For The Tourism Dataset:

Phase#4: ETL

We developed the ETL (Extract, Transform, Load) process using Python and the Pandas library, executed in a Jupyter Notebook environment. We began with extracting datasets pertaining to tourism and employment in the Kingdom of Saudi Arabia for the years 2021-2022 from Saudi open data. These datasets required several transformation steps to ensure they were in a suitable format for analysis and visualization. We translated values from Arabic to English to standardize the dataset and adjusted number formats to ensure numerical data was correctly interpreted and manipulated. Additionally, we converted the data from wide format to long format, simplifying the creation of our fact tables. We also performed data cleaning tasks, such as correcting inconsistencies in categorical data, removing duplicate records, and standardizing text formats, including the names of regions and other categorical variables, to maintain uniformity across the datasets.

Following these transformation steps, we merged relevant tables to form our fact tables, ensuring that each fact table was accurately linked to its corresponding dimension tables. The final step involved loading the transformed data into our data mart, structured according to the star schema we designed. This setup ensured optimized performance for querying and reporting. We then integrated the data mart with Tableau, where we created visualizations to represent our KPIs. This integration allowed for interactive and dynamic reporting, enhancing our ability to derive insights and support strategic decision-making.

In the upcoming sections, you'll find screenshots and explanations of crucial code snippets. These screenshots represent the primary steps in the process, some of which have been repeated. As a result, repetitive actions are not included to keep the focus on essential workflow aspects.

- **Date Dimension**

```
[1]: import pandas as pd

folder_path = 'DSS_DATASET_UPDATED.xlsx'
df = pd.read_excel(folder_path, sheet_name = '02')
# 02 = Purpose of Trips
# 03 = Number by Destination - Region
# 05 = Mode of Departure

df
```

[1]:

	(Last update: 26-06-2023)	Unnamed: 1	Unnamed: 2	Unnamed: 3	Unnamed: 4	Unnamed: 5	Unnamed: 6	Unnamed: 7	Unnamed: 8	Unnamed: 9	Unnamed: 10	Unnamed: 11	Unnamed: 12
0	NaN	NaN	NaN	NaN	NaN	NaN	NaN	NaN	NaN	NaN	NaN	NaN	NaN
1	NaN	Outbound Tourists Number by Main Purpose of Tr...	NaN	NaN	NaN	NaN	NaN	NaN	NaN	NaN	NaN	NaN	NaN
2	NaN	NaN	NaN	NaN	NaN	NaN	NaN	NaN	NaN	NaN	NaN	NaN	NaN
3	NaN	NaN	Month	Business	الأعمال	NaN	NaN	Leisure	*الترفيه*	NaN	NaN	Other	أخرى
4	NaN	NaN	NaN	Saudi	سعودي	Non-Saudi	غير سعودي	Total	الإجمالي	Saudi	سعودي	Non-Saudi	غير سعودي
5	NaN	2021	January	4.912	28.888	33.8	19.87	0	19.87	0	0	0	0

Define the file path for the Tourism dataset, then read the sheet '02'

```
[2]: col_list = ['Unnamed: 1', 'Unnamed: 2']

dim_table = df[col_list]

dim_table
```

```
[2]:
```

	Unnamed: 1	Unnamed: 2
0	NaN	NaN
1	Outbound Tourists Number by Main Purpose of Tr...	NaN
2	NaN	NaN
3	NaN	Month
4	NaN	NaN
5	2021	January

Create DataFrame 'dim_table' with the selected columns.

```
[9]: quarters = []
for month in dim_table['Month']:
    if month in months[0:3]:
        quarters.append('Q1')
    elif month in months[3:6]:
        quarters.append('Q2')
    elif month in months[6:9]:
        quarters.append('Q3')
    elif month in months[9:]:
        quarters.append('Q4')
    else:
        quarters.append(None)

dim_table['Quarter'] = quarters

dim_table
```

```
[9]:
```

	Year	Month	Quarter
0	2021	January	Q1
1	2021	February	Q1
2	2021	March	Q1
3	2021	April	Q2
4	2021	May	Q2
5	2021	June	Q2
6	2021	July	Q3
7	2021	August	Q3
8	2021	September	Q3
9	2021	October	Q4
10	2021	November	Q4
11	2021	December	Q4
12	2022	January	Q1
13	2022	February	Q1
14	2022	March	Q1
15	2022	April	Q2
16	2022	May	Q2
17	2022	June	Q2
18	2022	July	Q3
19	2022	August	Q3
20	2022	September	Q3
21	2022	October	Q4
22	2022	November	Q4
23	2022	December	Q4

In this cell we create 'Quarter' column to ensure consistency between the Emploment Dataset and the Tourism Dataset, because the Date Dimension serves as a shared dimension.

• Gender Dimension

```
[5]: gender_mapping = {
    'المذكر': 'Male',
    'الانثى': 'Female'
}

gender_dim_df.loc[:, 'Gender'] = gender_dim_df['Gender'].map(gender_mapping)

gender_dim_df
```

```
[5]:
```

	Gender
0	NaN
1	Male
2	Female
3	NaN
4	Male
5	Female
6	NaN
7	Male
8	Female
9	NaN

This part creates a dictionary (gender_mapping) to translate Arabic gender values to English. The mapped values are applied to the 'Gender' column of the DataFrame 'gender_dim_df'.

```
[6]: gender_dim_df = gender_dim_df.drop_duplicates().dropna().reset_index(drop=True)
gender_dim_df
```

```
[6]:
```

	Gender
0	Male
1	Female

```
[7]: gender_dim_df['Gender_ID'] = range(1, len(gender_dim_df) + 1)
gender_dim_df
```

```
[7]:
```

	Gender	Gender_ID
0	Male	1
1	Female	2

```
[8]: gender_dim_df = gender_dim_df[['Gender_ID', 'Gender']]
gender_dim_df
```

```
[8]:
```

	Gender_ID	Gender
0	1	Male
1	2	Female

This step involves cleaning the DataFrame by removing duplicate records and rows with missing values. The code assigns unique IDs to each gender category and creates a new column 'Gender_ID', essentially acting as the primary key for gender categories.

• Citizenship Dimension

```
[5]: citizens_dim_df = citizens_dim_df.drop_duplicates().dropna().reset_index(drop=True)
citizens_dim_df
```

```
[5]:
```

	Citizenship
0	Saudi سعودي
1	Non-Saudi غير سعودي
2	Total الاجمالي

```
[6]: citizens_dim_df['Citizenship'] = citizens_dim_df['Citizenship'].str.split('\n').str[0]
citizens_dim_df
```

```
[6]:
```

	Citizenship
0	Saudi
1	Non-Saudi
2	Total

```
[7]: citizens_dim_df = citizens_dim_df.drop(2)
citizens_dim_df
```

```
[7]:
```

	Citizenship
0	Saudi
1	Non-Saudi

```
[8]: citizens_dim_df['Citizenship_ID'] = range(1, len(citizens_dim_df) + 1)
citizens_dim_df
```

```
[8]:
```

	Citizenship	Citizenship_ID
0	Saudi	1
1	Non-Saudi	2

We remove duplicate rows, splits the values in the "Citizenship" column by newline ('\n') and keeps only the first line of each value, add the 'Citizenship_ID' column.

- **Tourism Location Dimension**

```
[9]: def format_region(region):
      words = region.split()
      formatted_words = []
      for word in words:
          if len(word) <= 3:
              formatted_word = word
          else:
              formatted_word = word.capitalize()
          formatted_words.append(formatted_word)
      return ' '.join(formatted_words)

      dim_table['Region'] = dim_table['Region'].apply(format_region)

      dim_table
```

```
[9]:
```

	Region
0	GCC
1	Middle East
2	Africa
3	Asia
4	Europe
5	America
6	Other Countries

Define a function called (format_region) that takes a region as input, splits it into words, capitalizes each word if it's longer than 3 characters, and then joins the words back into a single string. Then applies this function to the 'Region' column.

- **Tourism Purpose of Trips Dimension**

```
[7]: dim_table['Purpose'] = dim_table['Purpose'].str.replace('*', '')

      dim_table
```

```
[7]:
```

	Purpose
1	Business الأعمال
2	Leisure الترفيه
3	Other أخرى
4	Visiting Friends& Relatives زيارة الأصدقاء أو...

```
[8]: dim_table['Purpose_ID'] = range(1, len(dim_table) + 1)

      dim_table
```

```
[8]:
```

	Purpose	Purpose_ID
1	Business الأعمال	1
2	Leisure الترفيه	2
3	Other أخرى	3
4	Visiting Friends& Relatives زيارة الأصدقاء أو...	4

```
[9]: dim_table = dim_table[['Purpose_ID', 'Purpose']]

      dim_table
```

```
[9]:
```

	Purpose_ID	Purpose
1	1	Business الأعمال
2	2	Leisure الترفيه
3	3	Other أخرى
4	4	Visiting Friends& Relatives زيارة الأصدقاء أو...

```
[10]: dim_table['Purpose'] = dim_table['Purpose'].str.split('\n').str[0]

      dim_table
```

```
[10]:
```

	Purpose_ID	Purpose
1	1	Business
2	2	Leisure
3	3	Other
4	4	Visiting Friends& Relatives

Here we used the replace() function to clean the 'Purpose' column, we remove any asterisks found in the values of the 'Purpose' column and replaces them with an empty string.

- **Employment Fact**

```
[8]:
```

	Year - Quarter	Saudi Male	Saudi Female	Non-Saudi Male	Non-Saudi Female
0	الربع الأول 2021	1,365,654	723,789	6,051,404	250,388
1	الربع الثاني 2021	1,385,268	680,070	5,869,394	255,438
2	الربع الثالث 2021	1,416,888	718,420	5,762,323	260,754
3	الربع الرابع 2021	1,469,850	770,962	6,010,505	279,991
4	الربع الأول 2022	1,531,720	841,770	6,424,480	298,509
5	الربع الثاني 2022	1,563,771	879,182	6,787,008	311,661
6	الربع الثالث 2022	1,582,946	926,180	6,955,296	318,392
7	الربع الرابع 2022	1,611,085	970,330	7,019,759	321,864

```
[9]: fact_table = pd.melt(df, id_vars=['Year - Quarter'], var_name="Citizenship and Gender", value_name="Number_of_Employment")
fact_table
```

```
[9]:
```

	Year - Quarter	Citizenship and Gender	Number_of_Employment
0	الربع الأول 2021	Saudi Male	1,365,654
1	الربع الثاني 2021	Saudi Male	1,385,268
2	الربع الثالث 2021	Saudi Male	1,416,888
3	الربع الرابع 2021	Saudi Male	1,469,850
4	الربع الأول 2022	Saudi Male	1,531,720
5	الربع الثاني 2022	Saudi Male	1,563,771
6	الربع الثالث 2022	Saudi Male	1,582,946
7	الربع الرابع 2022	Saudi Male	1,611,085
8	الربع الأول 2021	Saudi Female	723,789
9	الربع الثاني 2021	Saudi Female	680,070
10	الربع الثالث 2021	Saudi Female	718,420
11	الربع الرابع 2021	Saudi Female	770,962
12	الربع الأول 2022	Saudi Female	841,770
13	الربع الثاني 2022	Saudi Female	879,182
14	الربع الثالث 2022	Saudi Female	926,180
15	الربع الرابع 2022	Saudi Female	970,330
16	الربع الأول 2021	Non-Saudi Male	6,051,404
17	الربع الثاني 2021	Non-Saudi Male	5,869,394
18	الربع الثالث 2021	Non-Saudi Male	5,762,323
19	الربع الرابع 2021	Non-Saudi Male	6,010,505

In this cell we use the melt() function to transform the dataframe from wide to long.

```
[10]: fact_table['Citizenship'] = fact_table['Citizenship and Gender'].str.split(' ').str[0]
fact_table['Gender'] = fact_table['Citizenship and Gender'].str.split(' ').str[1]

fact_table.drop(columns=['Citizenship and Gender'], inplace=True)

fact_table
```

```
[10]:
```

	Year - Quarter	Number_of_Employment	Citizenship	Gender
0	الربع الأول 2021	1,365,654	Saudi	Male
1	الربع الثاني 2021	1,385,268	Saudi	Male
2	الربع الثالث 2021	1,416,888	Saudi	Male
3	الربع الرابع 2021	1,469,850	Saudi	Male
4	الربع الأول 2022	1,531,720	Saudi	Male
5	الربع الثاني 2022	1,563,771	Saudi	Male
6	الربع الثالث 2022	1,582,946	Saudi	Male
7	الربع الرابع 2022	1,611,085	Saudi	Male
8	الربع الأول 2021	723,789	Saudi	Female
9	الربع الثاني 2021	680,070	Saudi	Female
10	الربع الثالث 2021	718,420	Saudi	Female
11	الربع الرابع 2021	770,962	Saudi	Female
12	الربع الأول 2022	841,770	Saudi	Female
13	الربع الثاني 2022	879,182	Saudi	Female
14	الربع الثالث 2022	926,180	Saudi	Female
15	الربع الرابع 2022	970,330	Saudi	Female
16	الربع الأول 2021	6,051,404	Non-Saudi	Male
17	الربع الثاني 2021	5,869,394	Non-Saudi	Male
18	الربع الثالث 2021	5,762,323	Non-Saudi	Male
19	الربع الرابع 2021	6,010,505	Non-Saudi	Male
20	الربع الأول 2022	6,424,480	Non-Saudi	Male
21	الربع الثاني 2022	6,787,008	Non-Saudi	Male
22	الربع الثالث 2022	6,955,296	Non-Saudi	Male
23	الربع الرابع 2022	7,019,759	Non-Saudi	Male
24	الربع الأول 2021	250,388	Non-Saudi	Female
25	الربع الثاني 2021	255,438	Non-Saudi	Female
26	الربع الثالث 2021	260,754	Non-Saudi	Female
27	الربع الرابع 2021	279,991	Non-Saudi	Female

Then, split the values in the "Citizenship and Gender" column into two separate columns and drops the original column.

```
[11]: gender_dim = pd.read_csv('Emp_Gender_Dim.csv')
gender_dim

[11]:   Gender_ID  Gender
0         1    Male
1         2  Female

[12]: fact_table = pd.merge(fact_table, gender_dim, on='Gender', how='left')
fact_table

[12]:   Year - Quarter  Number_of_Employment  Citizenship  Gender  Gender_ID
0      2021 الأول  1,365,654      Saudi      Male         1
1      2021 الثاني  1,385,268      Saudi      Male         1

Modifying Year and Quarter columns to match Date Dimension format.

Phase#5: Data Visualizations

Here we'll show the visualization for each KPI, we used tableau to create them.

For the Tourism Dataset KPIs:

1. Number of Tourists per Month

2. Number of Tourists by Citizenship

3. Number of Tourists by Purpose of Trips

4. Number of Tourists by Mode of Departure

5. Number of Tourists per Region

Number Of Tourists Per Region.

For the Employment Dataset KPIs:

1. Number of Employments per Quarter

Number of employments per quarter

2. Number of Employments by Citizenship

3. Number of Employments per Gender

4. Ratio of Gender by Citizenship

5. Ratio of Saudi to Non-Saudi Employment

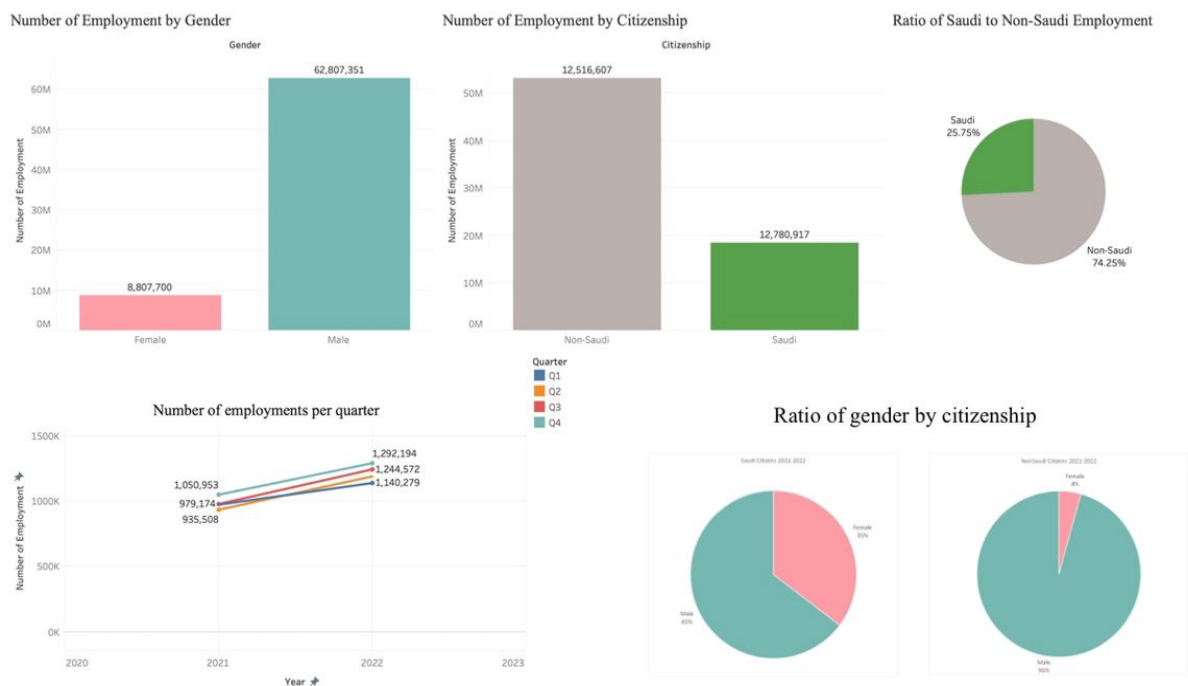

Dashboard for Each Dataset:

- Tourism Dashboard

- Employment Dashboard

Conclusion:

The analysis of the dashboards reveals no correlation between employment and tourism. Our data shows an increasing trend in the number of outbound tourists over time, particularly peaking in July. Although there are monthly fluctuations due to various unknown factors, the overall yearly trend in tourism is upward, with most trips being made to visit friends and relatives. Additionally, there is no significant difference in the number of Saudi versus non-Saudi tourists. Most tourists depart by air, and the GCC region receives more tourists compared to other regions.

The employment data indicates an increase in the number of employees during the fourth quarter, which could be attributed to seasonal and economic factors. The data also shows a higher percentage of male employees compared to female employees. Furthermore, a significant portion of the workforce is composed of non-Saudis, reflecting Saudi Arabia's reliance on foreign labor to meet certain skill requirements.

Work Distribution:
